

# Interações Intermoleculares

▲ **Figure 11.1** A microscopic view of a water droplet on the surface of a lotus leaf.

Gas

Chlorine,  $\text{Cl}_2$

Particles far apart; possess complete freedom of motion

Liquid

Bromine,  $\text{Br}_2$

Particles are closely packed but randomly oriented; retain freedom of motion; rapidly change neighbors

Crystalline solid

Iodine,  $\text{I}_2$

Particles are closely packed in an ordered array; positions are essentially fixed

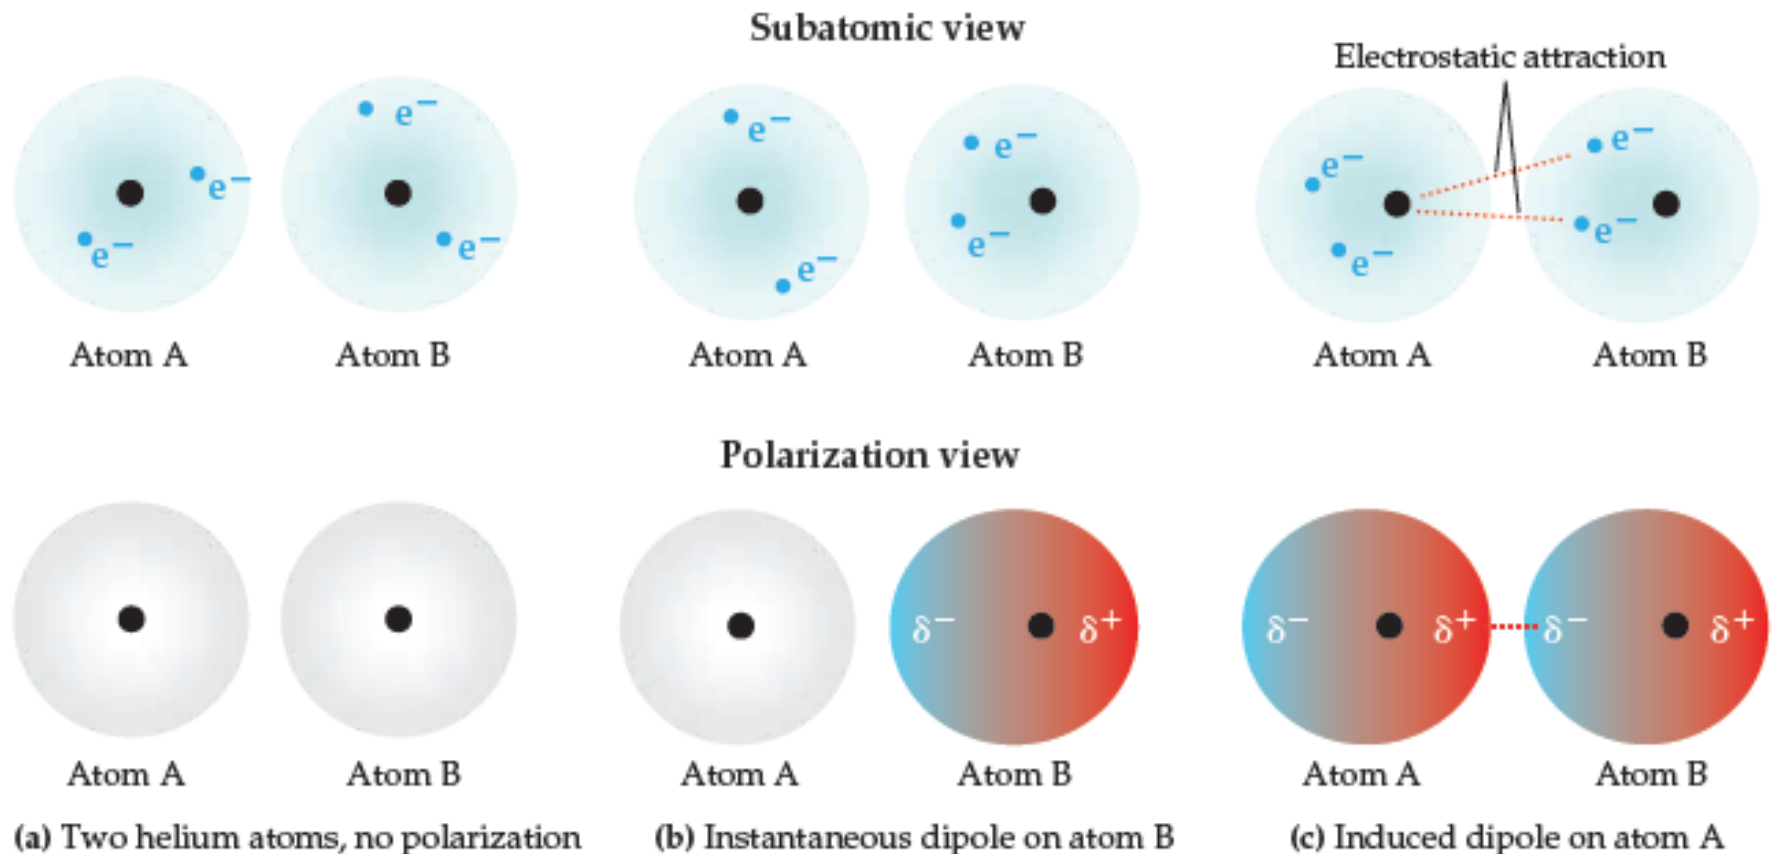

▲ **Figure 11.3** Intermolecular and intramolecular interactions.

**Table 11.3 Melting and Boiling Points of Representative Substances**

<b>Force Holding Particles Together</b>	<b>Substance</b>	<b>Melting Point (K)</b>	<b>Boiling Point (K)</b>
<i>Chemical bonds</i>			
Ionic bonds	Lithium fluoride (LiF)	1118	1949
Metallic bonds	Beryllium (Be)	1560	2742
Covalent bonds	Diamond (C)	3800	4300
<i>Intermolecular forces</i>			
Dispersion force	Nitrogen (N <sub>2</sub> )	63	77
Dipole–dipole force	Hydrogen chloride (HCl)	158	188
Hydrogen-bonding force	Hydrogen fluoride (HF)	190	293

# Forças de Dispersão (Forças de London)

▲ **Figure 11.4** Dispersion forces. “Snapshots” of the charge distribution for a pair of helium atoms at three instants.

# Efeito da Forma da Molécula

Linear molecule—larger surface area enhances intermolecular contact and increases dispersion force

*n*-Pentane ( $C_5H_{12}$ )  
bp = 309.4 K

Spherical molecule—smaller surface area diminishes intermolecular contact and decreases dispersion force

Neopentane ( $C_5H_{12}$ )  
bp = 282.7 K

# Interação Dipolo-Dipolo

▲ **Figure 11.7** Dipole-dipole Interactions. The dipole-dipole interactions in (a) crystalline  $\text{CH}_3\text{CN}$  and (b) liquid  $\text{CH}_3\text{CN}$ .

▲ **Figure 11.8** Molecular weights, dipole moments, and boiling points of several simple organic substances.

# Ligação de Hidrogênio

Why is the boiling point of  $\text{SiH}_4$  higher than that of  $\text{CH}_4$ ?

▲ **Figure 11.9** Boiling points of the covalent hydrides of the elements in groups 4A–7A as a function of molecular weight.

Onde as ligações de hidrogênio são mais importantes?

What is the approximate  $\text{H}-\text{O}\cdots\text{H}$  bond angle in ice, where  $\text{H}-\text{O}$  is the covalent bond and  $\text{O}\cdots\text{H}$  is the hydrogen bond?

▲ **Figure 11.11** Hydrogen bonding in ice. The empty channels in the structure of ice make water less dense as a solid than as a liquid.

Why does the O side of H<sub>2</sub>O point toward the Na<sup>+</sup> ion?

Positive ends of polar molecules are oriented toward negatively charged anion

Negative ends of polar molecules are oriented toward positively charged cation

▲ **Figure 11.13** Ion-dipole forces.

At which point in this flowchart would a distinction be made between  $\text{SiH}_4$  and  $\text{SiH}_2\text{Br}_2$ ?
